

# A store built around buying products

Version 2.0 | Revised from your six-page website blueprint | 19 September 2026

## The new primary outcome

A visitor finds a suitable product, understands exactly what they will receive, completes payment and can follow the order through delivery.

## [Certain] What this revision is based on

The supplied v1 blueprint prioritises lead capture, engineering reviews and custom quote requests. You have confirmed that the frontend, backend and database already exist. This revision changes the storefront structure and purchasing experience; it does not prescribe a replacement technology stack.

## [Likely] New website direction

Present Kaizen 3D Labs as a product brand with a clear catalogue. Let the product range, photographs, prices and practical details explain the offer. Place engineering services and custom enquiries on a separate route if those services remain available.

| Decision           | Blueprint default                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------|
| Primary customer   | An individual buying a listed product for personal use or gifting.                                                   |
| Primary action     | Shop products, then add a selected variant to cart and pay online.                                                   |
| Secondary customer | A buyer requesting personalisation, bulk quantities or a custom project.                                             |
| Product sourcing   | Support both own-made and sourced products. Describe each item accurately; do not imply all items are made in-house. |
| Stock model        | Show ready-to-ship or made-to-order status per item, with an actual dispatch estimate.                               |
| Success measure    | Completed orders from store visits, supported by checkout completion and fulfilment quality.                         |

## How to use this document

Pages 2-3 define the transformation and page structure. Pages 4-8 specify the shopping and order journey. Pages 9-10 set the visual rules, build sequence and launch checks.

**Evidence key:** [Certain] = supplied or directly observed information. [Likely] = recommended design direction, not a promised conversion outcome. This is a proposed implementation blueprint, not evidence that the current system has passed checkout testing.

# What changes from v1

Every original section gets a clear new purpose or destination.

[Likely] Proposed specification. Business-dependent choices are marked for confirmation.

| Original section       | New treatment                                                                                                                         |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 01 / Hero              | Replace the engineering pitch with real product imagery, a short shopping proposition and a Shop Products button.                     |
| 02 / The First Mark    | Move the full philosophy to About. Use only a short brand introduction near the bottom of the homepage.                               |
| 03 / Smart Quote Hub   | Move to Custom & Bulk. Standard products use product pages, cart and checkout.                                                        |
| 04 / Core Capabilities | Replace the homepage service grid with product categories. Keep offered services on a secondary page.                                 |
| 05 / Why Kaizen        | Replace broad engineering claims with buying information: product details, delivery clarity, support and authentic customer evidence. |
| 06 / How We Work       | Replace the homepage manufacturing workflow with ordering and delivery guidance. Put order progress in the customer order view.       |
| 07 / Industries        | Remove from the main shopping journey. Retain only on a relevant custom-services page.                                                |
| 08 / Featured Projects | Use featured products and genuine customer-use photos on the homepage. Keep case studies within custom services.                      |
| 09 / Final CTA         | Change the main closing action to Explore Products. Keep custom and bulk enquiries as a smaller secondary link.                       |

## Navigation hierarchy

**Desktop:** Logo | Shop | Collections | Custom & Bulk | About | Search | Cart. Put Track Order and support in a visible utility area. Add Account only if a useful account experience is available.

**Mobile:** Logo, menu and cart in a compact header; expose product search directly beneath it on browsing pages. Put shopping categories first in the menu.

### A practical rule for every page

A customer choosing a standard product should never have to select a material engineering specification, upload a CAD file or request an estimate to discover its price.

# Page map & entry routes

Build a connected storefront rather than a single long services page.

[Likely] Proposed specification. Business-dependent choices are marked for confirmation.

| Page / suggested route           | Purpose and primary action                                                                      |
|----------------------------------|-------------------------------------------------------------------------------------------------|
| Home /                           | Explain the range and introduce products. Action: Shop Products.                                |
| Shop /shop                       | Browse all published products. Actions: search, filter, open product.                           |
| Collection /collections/{slug}   | Group products by a useful category or occasion. Action: view product.                          |
| Product /products/{slug}         | Resolve buying questions and select options. Action: Add to Cart.                               |
| Cart /cart                       | Review items, quantities, variants and costs. Action: Checkout.                                 |
| Checkout /checkout               | Collect delivery details and payment. Action: Pay [final amount].                               |
| Confirmation /order-confirmation | Display the verified order/payment state and next step.                                         |
| Track Order /track-order         | Provide protected access to order status, shipment and support.                                 |
| Custom & Bulk /custom-bulk       | Collect an enquiry that needs a quote. Action: Send Enquiry.                                    |
| About /about                     | Explain the actual business, product selection and people behind it.                            |
| Help and policy pages            | Contact, FAQs, delivery, returns/refunds, privacy and terms. Publish actual operating policies. |

## Three journeys the design must support

**Instagram product visitor:** A product link opens the exact product page. Keep its campaign tags for reporting. A customer should not need to find the advertised item again on the homepage.

**Browsing visitor:** Home or collection page leads to a product, then cart, checkout and confirmation. Preserve filters and scroll position when returning to results.

**Custom or bulk buyer:** A secondary link from navigation or the relevant product opens an enquiry with product context already included. It creates an enquiry, not a paid order.

**Proposed starting collections:** Idols & Spiritual Gifts, Desk & Everyday Use, and Personalised Gifts. Confirm these against the launch catalogue; hide empty collections. Do not launch an elaborate category tree for a small range.

# Homepage specification

The top of the page should show what is for sale and how to start shopping.

[Likely] Proposed specification. Business-dependent choices are marked for confirmation.

| Order / section              | Layout, content and interaction                                                                                                                                         |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01 / Header                  | Compact navigation, product search and cart count. Optional announcement strip only for a real, currently valid message.                                                |
| 02 / Product hero            | One strong photograph showing actual products in use. Desktop: image beside copy. Mobile: short copy and Shop Products button with the image visible immediately below. |
| 03 / Shop by category        | Three or four image tiles, drawn from live collections. Each tile opens its collection page.                                                                            |
| 04 / Featured products       | Four to eight selected products, each with image, name, INR price and availability. Use Featured until sales data supports a Bestsellers label.                         |
| 05 / Product in everyday use | A real photo or short video showing size and use. Pair it with the relevant product link. Avoid a decorative animation that hides the product.                          |
| 06 / Buying confidence       | Short links to delivery information, product specifications and customer support. Show genuine reviews or customer photos only when available and permitted.            |
| 07 / Custom & bulk           | Compact secondary banner. Suggested text: Planning a personalised gift or a larger order? Button: Enquire About Custom & Bulk.                                          |
| 08 / Brand & footer          | Short About preview, then Shop, Track Order, Contact, delivery and policy links. Include business contact information and active social links.                          |

## Suggested hero copy

### Find something worth keeping.

Explore products for your space, everyday use and gifting.

**Primary button:** Shop Products

**Secondary text link:** Explore Collections

This copy is a proposed starting point for the current product direction. Finalise it after selecting the launch range. Use a product-led headline if one category becomes the clear focus.

## Homepage behaviour

Keep the hero static by default. Avoid auto-advancing banners and entry pop-ups. Every visible product links to a dedicated page. Show fewer useful sections when photography or review evidence is unavailable; do not fill the gaps with invented proof.

# Catalogue, search & discovery

Help customers narrow the range without making them learn your production process.

[Likely] Proposed specification. Business-dependent choices are marked for confirmation.

## Shop and collection page layout

Show the page title, a short category description where helpful, result count, sort control and filter access above the grid. Use four product columns on wide screens and two on mobile, with readable names and prices.

| Component           | Required behaviour                                                                                                                                                                    |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product card        | Consistent image ratio; descriptive name; price in INR; honest availability. Show From only when it is the lowest purchasable variant price. Use Choose Options for variant products. |
| Search              | Search names, categories and useful customer terms. Include matched products and relevant collections. Preserve the query when moving between results and product pages.              |
| Filters             | Start with category, price and availability. Add colour, size or personalisation only where the catalogue supports them. Show applied filters and Clear All.                          |
| Sorting             | Featured, price low to high, price high to low and newest. Use a sales-based sort only when actual data supports it.                                                                  |
| No results          | State that no products match. Offer Clear Filters, a revised search and relevant categories; keep the current query editable.                                                         |
| Sold-out item       | Keep its product page available with an explicit sold-out state. Disable purchase for unavailable variants and show available alternatives.                                           |
| Loading and failure | Keep the grid layout stable while loading. If loading fails, provide Retry rather than an apparently empty catalogue.                                                                 |

## Merchandising rules

Use categories for what the item is, and collections for the occasion or purpose. A product can appear in multiple collections without creating duplicate products or separate stock counts.

Feature items with complete photos, clear pricing and reliable fulfilment. Link each campaign to the exact collection or product being promoted. When a featured item sells out, offer a relevant alternative rather than leaving a purchase dead end.

### Avoid false certainty

Do not display invented discounts, countdowns, stock scarcity, review counts or bestseller badges. A simple, accurate product card is sufficient.

# Product page specification

The product page must answer: What is it, will it suit me, what will it cost, and when will it arrive?

[Likely] Proposed specification. Business-dependent choices are marked for confirmation.

## Desktop and mobile layout

**Desktop:** Gallery on the left; title, price, options and purchase panel on the right. Put supporting details underneath. **Mobile:** Gallery, title and price, options, delivery estimate, then Add to Cart. A bottom purchase bar may repeat the selected price and action without covering content.

| Area                 | Content and behaviour                                                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Image gallery        | Actual product from front, side and in use, plus one clear scale reference. Zoom on tap. Mark digital renders as previews; show what the delivered item actually looks like.               |
| Purchase summary     | Name, brief purpose, INR price and availability. Ratings appear only if genuine. Change price, photo and stock when the selected variant changes.                                          |
| Options              | Only sellable combinations of colour, size or finish. Label each option. Require a choice where necessary and explain why a combination is unavailable.                                    |
| Personalisation      | Show text limits, accepted characters, additional price and dispatch impact before adding to cart. Keep simple priced options in checkout; send complex requests to a quote.               |
| Delivery information | Use postcode eligibility where supported. Show dispatch time and an estimated delivery range based on the selected item and destination. State any shipping cost or when it is calculated. |
| Product facts        | Dimensions with units, material, colour/finish, included items, care instructions and verified usage limits. For 3D prints, explain visible layer texture where relevant.                  |
| Actions              | Primary: Add to Cart. On success, show the selected item and links to View Cart or Continue Shopping. Secondary: Ask About This Product with its context included.                         |
| Below purchase panel | Description, delivery/returns summary, FAQs, authentic reviews and a small set of related products. Link to full policies.                                                                 |

**Content pattern:** [Product name] / [one-sentence use] / [price] / [selected options] / [dispatch estimate] / Add to Cart. Bracketed fields are content inputs, not text to publish.

**Availability rule:** Distinguish In Stock, Made to Order and Sold Out. For sourced products, use confirmed supplier availability and your actual dispatch process; do not imply ready stock when it is not held.

# Cart, checkout & payment

Make the amount and the next step clear at every point.

[Likely] Proposed specification. Business-dependent choices are marked for confirmation.

## Cart

Show a thumbnail, product name, chosen variant, personalisation, quantity and line total. Allow edit and remove. Explain quantity limits. Display subtotal, discounts and delivery charges when known; otherwise say Calculated at Checkout. Never show a zero delivery charge as though it were final when the destination is unknown.

## Checkout

| Step         | Required experience                                                                                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 / Contact  | Allow guest checkout. Collect the contact details needed for confirmation and delivery. Offer account creation after purchase if supported.                                              |
| 2 / Delivery | Name, phone, address and postcode. Validate eligibility and show helpful field errors. Preserve details if the customer goes back or payment fails.                                      |
| 3 / Review   | Show products and options, address, expected dispatch/delivery, shipping charge, discount and final total. Display applicable tax treatment consistently with configured business rules. |
| 4 / Pay      | Use the available payment integration for enabled methods. Label the action Pay [amount]. Show only methods the business actually supports; offer COD only if enabled.                   |
| 5 / Confirm  | Display the order number, payment state, item summary, paid total, delivery address and next step. Link to protected order tracking and support.                                         |

## Payment states that must be designed

**Processing:** Prevent repeated payment submissions and explain that confirmation is in progress.

**Pending:** Tell the customer that verification is still underway. **Failed or cancelled:** Preserve their cart and details and offer a safe retry. **Paid:** Show payment received only after a verified payment result.

## Implementation acceptance contract

The backend must validate prices, options, discounts, delivery fees and availability before payment. Payment retries and repeated provider notifications must not create duplicate orders or charges. Define stock reservation and release rules for abandoned or failed payments. If an item becomes unavailable, explain the change before accepting payment.

### Confirmation copy pattern

Payment received. Your order [order number] is confirmed.

Estimated dispatch: [date or range].

Track your order for the latest updates.

Use this wording only for a verified successful payment. A pending payment gets a different message.

# After purchase & store operations

A sale continues through fulfilment, delivery and any support request.

[Likely] Proposed specification. Business-dependent choices are marked for confirmation.

## Customer order view

Show confirmed, preparing, shipped and delivered states based on real operational updates. Keep payment status separate from fulfilment status. When applicable, show cancellation, return requested and refund status with the next customer action.

Provide shipment tracking once available. Protect order details through an account or a secure guest link/verification flow; an order number alone must not reveal a customer address. Let customers contact support with the order reference prefilled.

| Existing system area    | Required storefront capability                                                                                                                                     |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product management      | Publish/unpublish products; manage descriptions, images, categories, variant prices and stock. Store dimensions, material, dispatch estimate and fulfilment type.  |
| Order management        | View items, selected options, contact/address, verified payment state and fulfilment state. Record dispatch, tracking and support actions.                         |
| Stock management        | Update stock per variant. Define available quantity or capacity for made-to-order items. Treat supplier-confirmed availability distinctly from stock held locally. |
| Store settings          | Manage delivery coverage/charges, actual return and cancellation rules, contact details, payment methods and featured collections.                                 |
| Customer messages       | Send order and shipment updates only for real state changes. Use the configured communication channels; avoid duplicate notifications.                             |
| Custom & bulk enquiries | Keep a separate enquiry record with product reference, quantity, desired date, customisation and contact details. Show an agreed response expectation.             |

## Custom & bulk page

Use a short form for name, contact, selected product or requirement, quantity and required date, with optional reference upload and notes. Do not require a CAD file or engineering material choice from gift buyers. If engineering work is still offered, reveal technical inputs only for that enquiry type.

## Operational inputs to confirm before launch

Final product range and prices; stocked versus made-to-order fulfilment; delivery regions and dispatch times; personalisation limits; returns and cancellations; active payment methods; and the person responsible for order updates. These are business settings, not reasons to redesign the database from scratch.

# Visual direction & content rules

Premium through product clarity, consistent photography and restrained design.

[Likely] Proposed specification. Business-dependent choices are marked for confirmation.

| Element              | Proposed specification                                                                                                                                                       |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Overall style        | Light neutral shopping surfaces, dark readable text and a restrained cobalt accent. Use the existing Kaizen identity with product photography as the main visual focus.      |
| Typography           | One readable type family with a clear hierarchy. Aim for 16 px body text in the storefront; keep price, option labels and delivery text easy to read on mobile.              |
| Product imagery      | Consistent 4:5 or square image crops across cards. Use neutral backgrounds for comparison and real-use photos for scale. Avoid crops that hide included parts.               |
| Buttons and feedback | One prominent primary action per area. Show visible loading, success, error and disabled states. Label icon buttons and maintain keyboard focus visibility.                  |
| Mobile controls      | Use generously spaced tap targets, labelled colour choices and a simple filter drawer. Keep overlays dismissible and avoid covering checkout or consent controls.            |
| Motion and speed     | Limit decorative motion. Serve appropriately sized images; prioritise the main product image and load lower content as needed. Respect reduced-motion preferences.           |
| Accessibility        | Use readable contrast, descriptive image text, visible form labels and understandable errors. Do not communicate option availability or payment status through colour alone. |

## Product content checklist

Each published item needs a name customers understand, correct price, available variants, real photos, size, material, included items, stock/dispatch status and relevant delivery/return information. Show sourced products and own-made products with accurate descriptions.

## Search visibility specification

Give every product and collection a stable, shareable URL, unique title and useful description. Provide indexable product content, a sitemap and accurate product metadata for price and availability. Plan redirects for changed URLs and avoid publishing empty or duplicate collection pages. These are implementation requirements, not a ranking guarantee.

### Proof before promises

Avoid copying v1 claims about guaranteed quality, engineering outcomes, NDA protection or response times unless the business can support them. For the storefront, publish specific facts customers can verify.

# Build sequence & launch criteria

Deliver the core purchase journey first, then improve it with observed customer behaviour.

[Likely] Proposed specification. Business-dependent choices are marked for confirmation.

| Sequence                    | Reviewable output                                                                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 1 / Catalogue and structure | Agree the launch items, categories, prices, dispatch rules and page map. Map requirements to the existing frontend, backend and database.   |
| 2 / Core shopping screens   | Create mobile and desktop home, collection, product, cart, checkout and confirmation screens, including empty and error states.             |
| 3 / End-to-end purchase     | Connect product data, stock, delivery calculation, payment verification, order recording and customer confirmation.                         |
| 4 / Fulfilment and content  | Connect tracking and store management. Publish real photos, product details, contact information and agreed policies.                       |
| 5 / Launch and learn        | Verify the cases below using payment test mode. Review the complete mobile journey, then monitor orders and customer friction after launch. |

## Launch acceptance checks

1. A mobile visitor can reach a product from Instagram, select an available variant and complete a guest purchase.
2. Correct options, stock limits, personalisation, delivery charge and final total persist from product to order.
3. Failed, pending and retried payments preserve customer progress without duplicate orders; success requires verified payment.
4. An unavailable variant or unsupported delivery location is explained before payment.
5. The customer receives accurate confirmation and can securely track the order; staff can fulfil it.
6. Search, filters, no-results, empty cart and form errors all provide a clear next step.

## Measurement plan

**Primary:** Purchase conversion = sessions with at least one verified completed purchase / eligible storefront sessions, using a consistent date range and excluding test/internal traffic.

**Supporting funnel:** Product view, add to cart, begin checkout and completed purchase. Also review revenue, payment failures and cancellations/refunds. Record a purchase once per order after verification; a confirmation-page reload is not a new purchase.

Segment by device and campaign source. Improve the stage with the clearest observed drop-off; do not promise a target conversion rate without a baseline.

**Later enhancements:** Wishlists, loyalty points, complex bundles, recommendations and automated marketing can follow when demand and operations justify them. The first release must already support a complete purchase and fulfilment journey.

**Source:** Kaizen\_3D\_Labs\_Website\_Blueprint.pdf, v1.0, supplied by the user, pages 1-6; current instruction confirming existing frontend, backend and database. All new layouts, copy and flows in this document are proposals.
